

### **Freedom Industries Update for February 6, 2014**

The following updates are for the 24 hour operational period (12:00 pm on February 5, 2014 to 12:00 pm on February 6, 2014):

OSC Matlock reported that the facility continued to focus most of their effort on managing both offsite water flowing onto the Site and water migrating through the Site. A large amount of water continued to be pumped from the site into onsite tanks (T401) for temporary storage.

The water level in the Elk River has started to decline. Attention continued to focus on maintaining the booms along the impacted shoreline.

The facility's contractor, CEC, expects to begin sampling of 3 onsite monitoring wells today. WVDEP, EPA, and the plaintiff representatives anticipate collecting split samples. The facility also plans on collecting a surface water sample at the culvert entering the tank farm containment area.

The facility continued to develop a plan that will divert offsite water currently flowing into the facility and will reroute it to discharge directly into the Elk River.

CSB was onsite yesterday continuing their investigation.

FBI was onsite today to complete a 3D map/survey of the property as part of their ongoing investigation.
